Enter the code you see on your watch and select PAIR. Need help? For help setting up and troubleshooting, check out the Wear OS support page. Check out other articles on our support site for help with your Spotify account and payments, or if you can't play music. Last updated: 26 November, 2020 One of the most demanded features on smartwatches is the ability to listen to music using this device. Officially we can now install Spotify on watches with Google Wear OS. What are you waiting for to prove it? Spotify is one of the most used resources by those who like music, both for its large catalog of songs, as well as for its free version that allows you many functionalities. On Android Wear, Google's smartwatch operating system was already a Spotify app, but it's no longer updated and more convenient alternatives appeared. Now with the advent of Wear OS (the new Android Wear), the company has launched a new official application where you can listen to your playlists, radio, and much more. We need to tell you that on Android watches (those that have an Android version adapted to a smartwatch), you can download the normal Spotify app, and use it as if it were a phone. According to the company this is the first version of different updates that promise to bring improvements. Download Spotify on Wear OS Currently smartwatches with Wear OS must download the app from the Play Store repository, in order to use it. Just go to the Play Store and download the app (in theory it should appear in all countries including Spain). The detailed steps to have Spotify would be as follows: Download Spotify from the Google Play Store on your smartwatch. Sign in to your account and log spotify.com/pair a code will appear on your smartwatch to link it to your account. The Spotify app uses different connectivity available, including Wi-Fi, LTE and Bluetooth, to play music. But for new watches that may appear in the coming months, Spotify will arrive pre-installed, carefree about having to download it, and just linking your personal account to the one you have on your watch. Some of the watches that will appear with the app will be the new Fossil or Michael Kors design watch. KNOW MORE &t Meet the best GPS watches on the market. Spotify at the moment with en Wear Wear One of the advantages that this application gives us (in its mobile or desktop version) is to be able to listen to songs in offline mode (with the premium account). Unfortunately at the moment you won't be able to access this functionality on your smartwatch, so you won't be able to access the music if you don't have a connection. On Garmin Fenix or Samsung watches you can listen to songs offline. Only Garmin and Samsung (Tizen) had support for Spotify in their wearables, currently joining Wear OS. If you have a smartwatch with memory capabilities, you could have taken advantage of this functionality. So we can browse to listen to songs or lists, and listen to them by speakers that are compatible with Spotify Connect. You can even add your songs to favorites like in the desktop or mobile version. We think that having access to Spotify on Wear OS is a great advantage for the operating system that competes with the Apple Watch. This one doesn't have this app in its catalog yet. It seems clear that Google and its partners must strengthen the Wear OS operating system, with applications like this one, before the market is more divided among other operating systems. It's been four years since Android Wear, the smartwatch operating system developed by Google, was released. Today, after so long and having been renamed Watch OS, it has finally received an official Spotify app. This is announced by the service itself in its official blog, stating that this app will arrive on November 4th. So far, what Spotify users had available was a standard player that worked the same with any app. That meant having to take out the phone, put the music on and then yes, you could control the playback and pause the songs. This new application is standalone. While it will still be necessary to have Spotify installed on mobile, you will now be able to access the music directly from the watch, which slightly simplifies the task. Also, among the available options offered by the app are pause and continue playback, change songs, access the playlists, save them to the library and even play them on other devices using Spotify Connect. It also works with podcasts. The firm has also taken the opportunity to announce its partnership with Fossil to bring its new release to the Fossil Gen 4 and Michael Kors Access Runway. However, it can be used on any wearwatch that has Wear OS. Simply download the Spotify app to your mobile and have your watch connected via Bluetooth. Until now we could use Spotify on any smartwatch, the problem is that it was through the mobile phone, with the restrictions that this entails. But now, with the advent of Spotify Wear things change by significantly expanding the functionality the application of the successful streaming music platform. Spotify plans to remove ads from the free version Yes, you have to have a little patience as the company has announced that its new app will reach the smartwatches worldwide throughout the coming week. This way you can download it independently from your watch or phone in the Google app store. The only requirement? Wear OS 2.0 or above. This is how Spotify Wear works for smartwatches In terms of the functions that come with the official Spotify app for devices with Wear OS 2.0 or higher, say that you can play, pause and skip songs, as well as explore new music and podcast directly from the watch app. Another detail to keep in mind is that the app is compatible with Spotify Connect, so you can play content from your smartwatch on any compatible speaker. There's even the heart icon next to the songs to add to our music library. Do you take advantage of your Wear OS smartwatch? With these tricks you will get it The only one but we have found this update is the fact that the Spotify version for smartwatches with Wear OS does not allow you to listen to music offline. For now there will be no support to use offline lists, although we hope that future versions of the application will allow us this feature as it would greatly improve its usability. Imagine being able to go for a run with your smartwatch and use the streaming music service app to listen to the music lists you want without the need for an Internet connection. Sounds appetizing, doesn't it? More so when you consider that the company has reached an agreement with several manufacturers so that the Spotify Wear app arrives pre-installed on your devices. Smartwatches are the feeling and it's that who doesn't want to carry all kinds of information and applications on their wrist. Imagine now that you can use Spotify on Smartwatch Wear OS even to download music, songs and podcast with Spotify for free. Well, for a while now, there's a way and it's as simple as writing this post. There is the official APP plus an APK and today you will discover the wonders and advantages of both. Spotify on Smartwatch Wear OS Official vs. Apk The official version of Spotify, Spotify Lite, is already in store and you can get it whenever you want in a very simple way. It is available for Android 6 and iOS 11 and above. With it, you can listen to your favorite melody over and over again by learning to repeat the same song multiple times on Spotify. In turn, create custom covers for Spotify playlist easily. The first step is to download it from the Play Store directly from your watch, then from any device (computer, clock, phone). Visit spotify.com/pair, enter your details and Log in (in if you don't have an account, Sign up). After this a code will appear on your watch, enter it and press Pair, ready, you can now use Spotify on Smartwatch Wear OS. With Spotify Lite, you can control everything from your wrist: see the one playing, save content, play, pause, jump, etc. Finally and more importantly, you can control music from another device with Spotify Connect. Its APK version An APK is an executable file that allows you to download applications without having to go to the Play Store, executables on your phone once downloaded. In the case of Spotify for SmartWatch the application was created in this format, because it was the only way to adapt it to the watch. Thus, it would not suffer as with other applications that have tried to pass, and end up being unstable presenting Bugs. Taking this out of the way to download Spotify on Smartwatch Wear OS, from an APK is something very easy, this alternative version was created by moneytoo, a developer of XDA. The first thing that made this well-called genius, was to do it so that you don't need a Smartphone to work, you don't need Bluetooth, second divided the drawable file packages, to make the app even more compatible. He also started playing with the design of the controls, which were much more comfortable, (the buttons are all over the width of the screen), and finally increased the height of the actionbarzise. Now how do you get it?, you just have to search the web for the APK file, download it and install it as with any other file package of this type, and you already have Spotify on SmartWatch Wear OS and you can now use the app. Definitely the APK version is wonderful both really are, what makes this one more comfortable is that it adapts to the watch screen, allowing better functionality when it comes to using it. The application of the future grows thanks to the help of all As mentioned earlier both versions shown today are perfect and work great, and it is partly thanks to third-party developers, that many companies improve their applications, since it gives you the opportunity to polish and try new things. By lowering it in both ways, Spotify wins and you contribute, making part of the wheel that spins at full speed to improve our lives, not only as users of an APP but in general, deserved respect for the developers who work every day to provide the best products. Products.
